Aotearoa New Zealand

The background of the slide features a close-up, slightly blurred image of several blue-topped vaccine vials. The vials are arranged in a row, and their labels are partially visible, showing the text 'COVID-19 VACCINE'. Overlaid on this image is a complex, white, geometric network pattern consisting of numerous small dots connected by thin lines, resembling a molecular structure or a data network. The overall color palette is dominated by the blue of the vials and the white of the network lines, set against a dark, muted background.

Congratulations! We have COVID-
19 vaccines
...now for the next challenges.

Helen Petousis-Harris, PhD
Associate Professor, University of Auckland

The safety challenges

What are we in for?

Auckland Mum of two dies just days after coronavirus vaccine, family distraught

Norway adjusts advice for elderly and frail people after COVID-19 vaccine deaths

COMMENTS

By Euronews with AP • Updated: 15/01/2021

Svein Andersen was the first in Norway to receive the coronavirus vaccine in the capital Oslo, Sunday, Dec. 27, 2020. • Copyright: Fredrik Hagen/NTB

How do we make sense of this?

Potential stage in the evolution of an immunisation programme, vaccine safety.

Yonatan Moges Mesfin et al. BMJ Glob Health 2019;4:e001065

Separating legitimate events from coincidence

- If 10 million individuals were vaccinated in the UK, 21.5 cases of Guillain-Barré syndrome and 5.75 cases of sudden death would be expected to occur within 6 weeks of vaccination as coincident background cases.
 - need >4million to detect a 2-fold difference
- 397 per 1 million vaccinated pregnant women would be predicted to have a spontaneous abortion within 1 day of vaccination.

Vs.

**COINCIDENCE. THAT'S AN
EXPLANATION USED BY
FOOLS AND LIARS.**

Beyond rare
events –
vaccines and
people are not
all the same

COVID vaccines vary

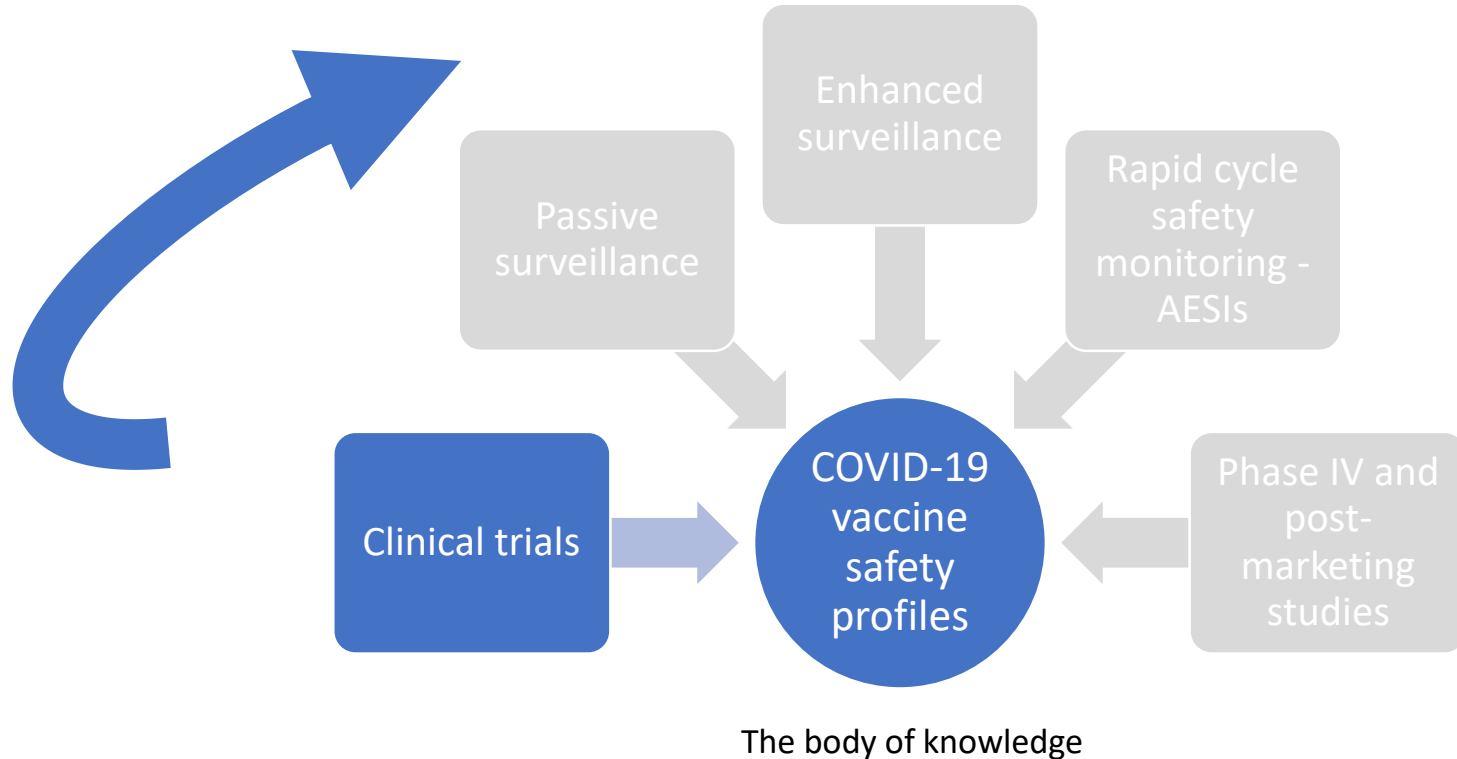

The diagram consists of four rounded rectangular boxes stacked vertically. Each box is connected to a horizontal line on its right side, which then connects to a vertical line on the left side of the box below it. The boxes are colored blue, teal, green, and olive green from top to bottom. The text inside each box is white.

Populations vary

Healthcare varies

Seasons vary

Knowing the safety of COVID-19 vaccines

Some limitations of clinical trials

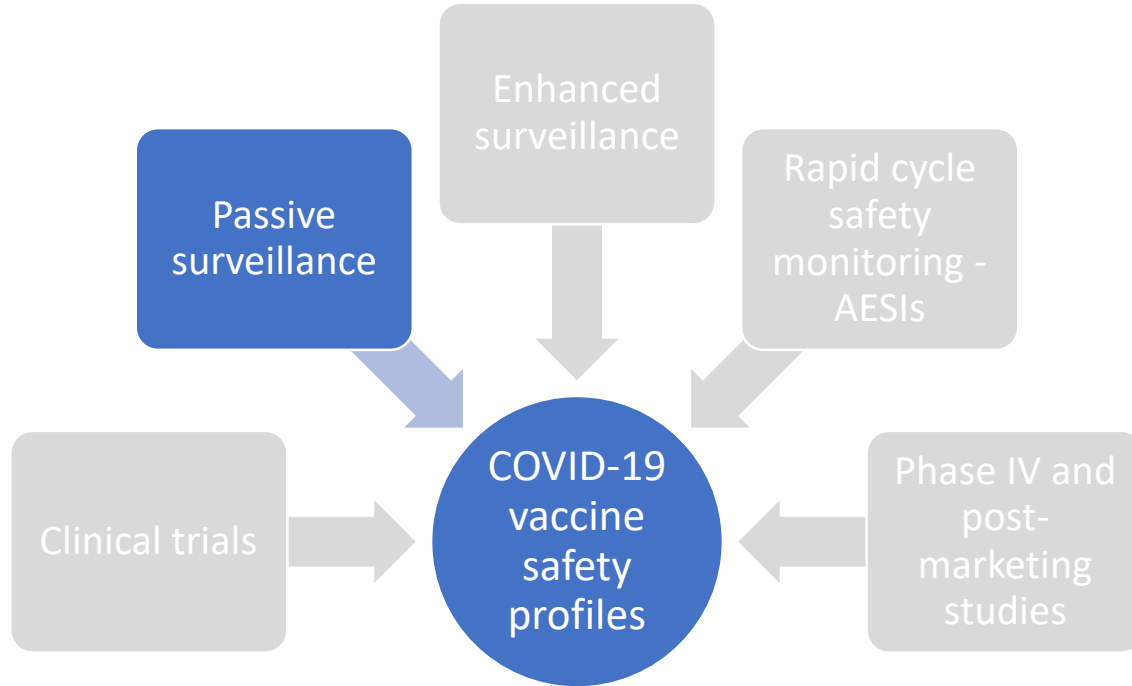

- Phase III trials need to be big enough to show that
 - the vaccine prevents the disease.
 - Provide sufficient evidence of safety.
- Not big enough to measure rare events.
- Cannot measure indirect effects
 - i.e community immunity, transmission
- Participants might not be genetically diverse
 - Almost no Polynesian trial participants
 - We know from NZ vaccine studies that ethnicity is strongly associated with vaccine responses and vaccine effectiveness independent of other variables

The Solutions

After deployment

Knowing the safety of COVID-19 vaccines

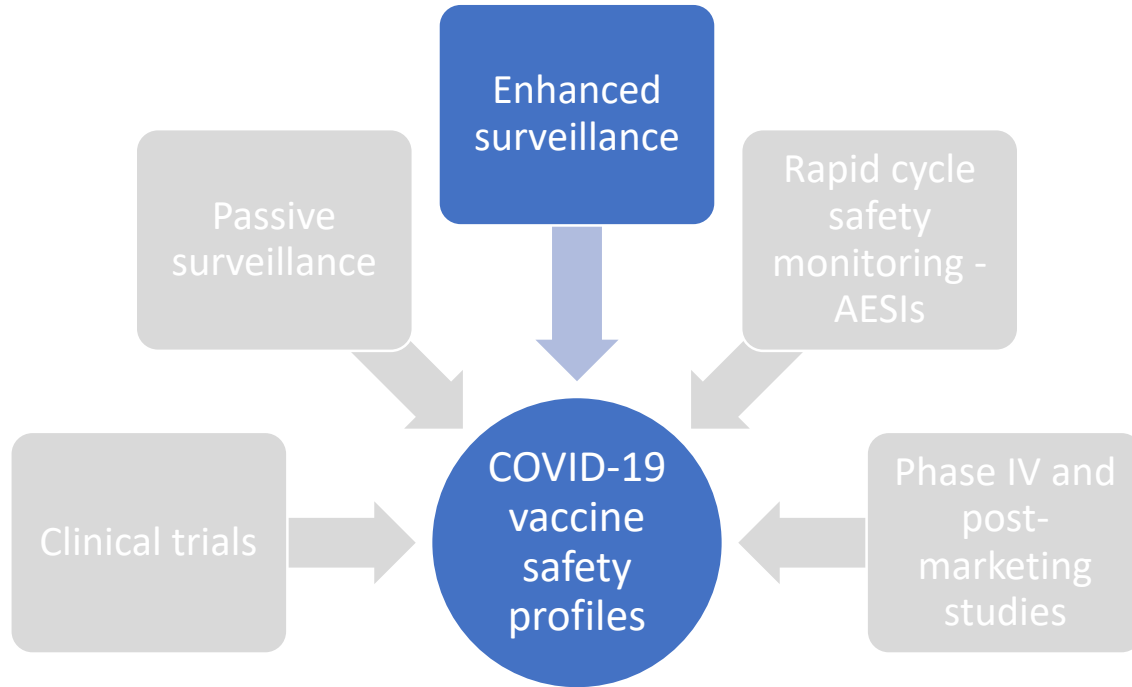

Spontaneous safety surveillance

- Passive safety surveillance (voluntary reporting of AEFI)
 - Most countries have one
 - Most contribute to the WHO Uppsala pharmacovigilance monitoring centre (Vigibase)
- ✓ Good for signal detection
- ✗ Cannot help with causality assessment

Knowing the safety of COVID-19 vaccines

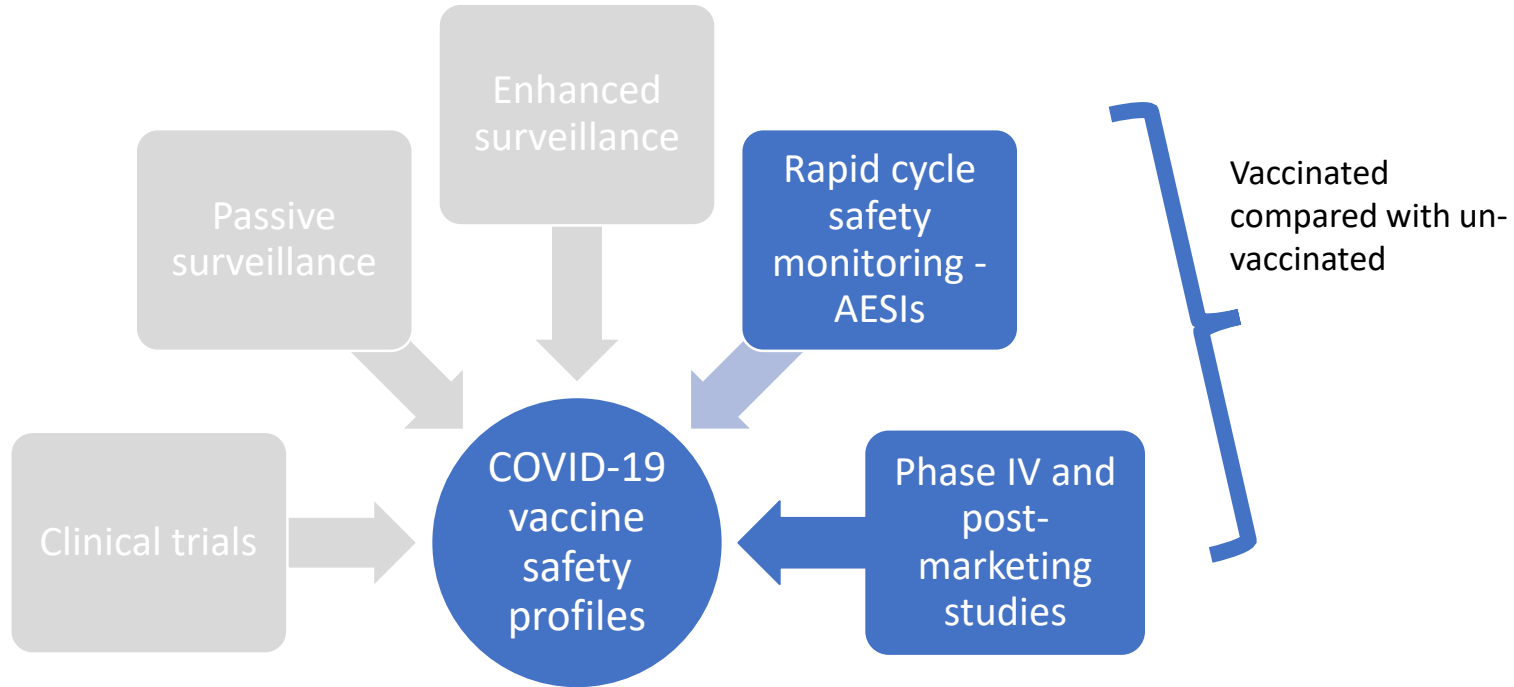

Enhanced/active monitoring

- e.g. Use of digital technologies to actively collect post vaccine adverse events
 - SmartVax
 - Vaxtracker
 - KiwiVax ☺
- ✓ Reveal events not picked up by GP visit
- ✓ Involve patients in pharmacovigilance
- ✗ Cannot be used to infer causality of complex or rare events
- ✗ No unvaccinated for comparison

The most urgent immediate task for most countries is to establish the normal background rates for the adverse events of special interest.

WHO, Global Advisory Committee on Vaccine Safety,
May 2020

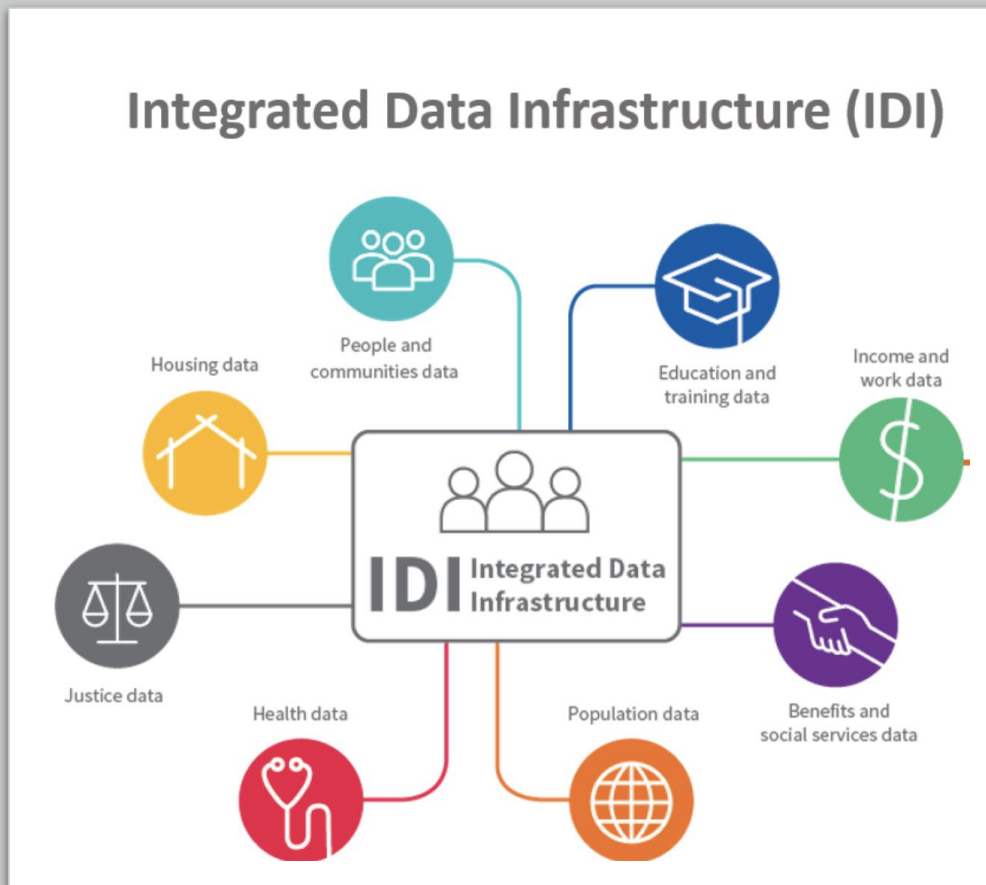

Knowing the safety of COVID-19 vaccines

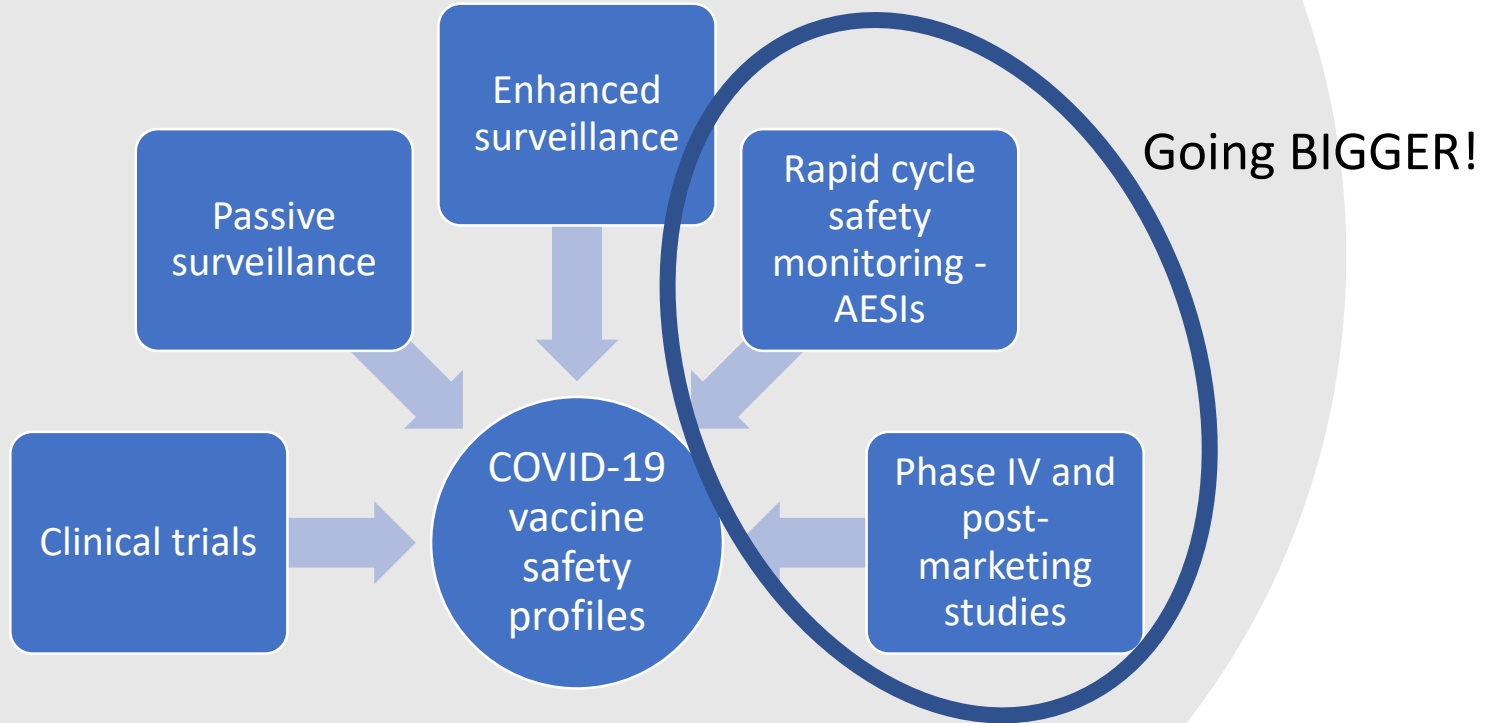

National or site specific:

NZ has exceptional data. We can do vaccine safety monitoring and studies second to none

... but our population is very small

Knowing the safety of COVID-19 vaccines

Distributed networks

- Using common methods/protocols at different sites, **different countries**
- Combining outcomes in a kind of meta-analysis
- Systems may vary but if everyone uses the same approaches, same definitions then we can combine findings
- The EU and US have

But don't assume they have all of this covered

Just last month...

The New York Times

The F.D.A. is struggling to start up its comprehensive monitoring system for vaccinations.

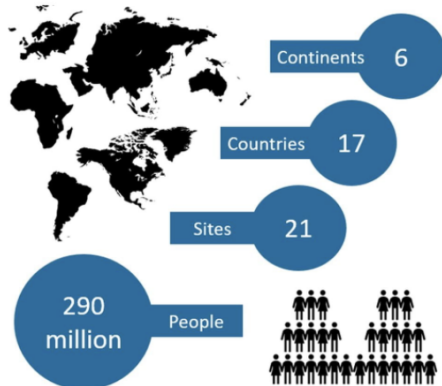

As Millions Get Shots, F.D.A. Struggles to Get Safety Monitoring System Running

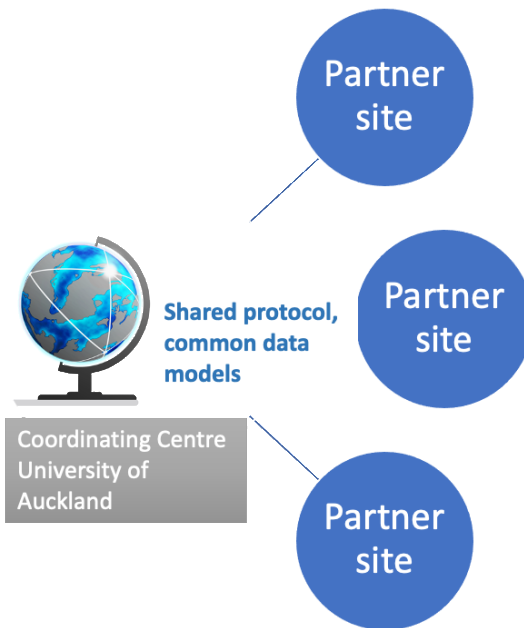

For now, the government has been relying on a patchwork of programs that officials say are hampered by limited size and gaps in data collection.

The Global Vaccine Data Network

The GVDN uses Big Data to assess vaccine safety and effectiveness across large and diverse populations around the world and over time.

20. United States, Vaccine Safety Datalink, Centers for Disease Control and Prevention, Georgia
21. United States, Centers for Medicare & Medicaid Services, U.S. Food & Drug Administration, Maryland

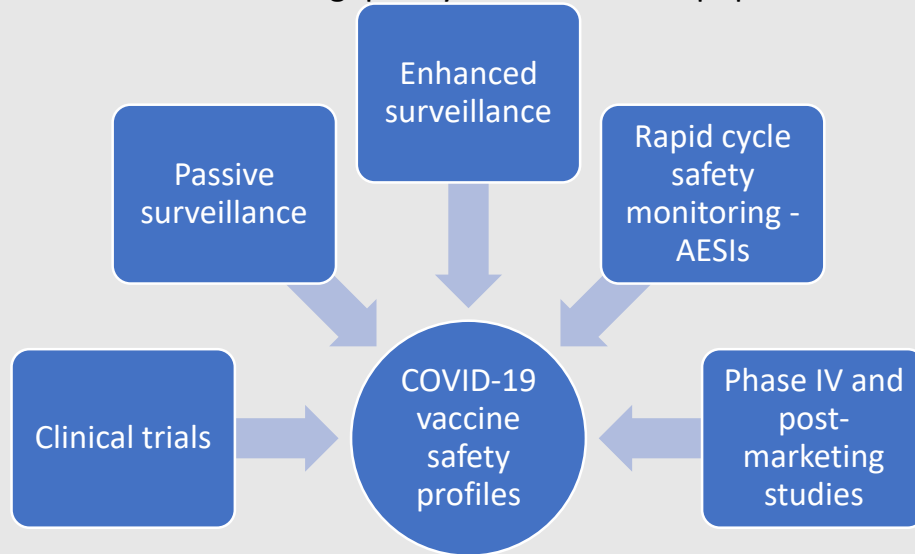

Ultimate solution: Global Distributed Networks

Founding support from Gates. Endorsements from Brighton Collaboration and CEPI

Take home messages

- Safety scares can derail immunisation programmes
- Pre-clinical and clinical data give us optimism that COVID-19 vaccines will have a good safety profile.
- We have exceptional tools and protocols at our disposal and can detect and verify rare adverse events.
- However, there are global delays in implementation, leaving us vulnerable to responding to safety scares over the next few months
- Safety data beyond the clinical trials accumulating quickly - and in diverse populations.

Collective body of knowledge

A healthcare worker wearing a blue surgical mask, a clear face shield, and dark scrubs is administering a vaccine to a man. The man is wearing a blue surgical mask and a black t-shirt with the text 'AKO NGATTE' in teal. He has a large, intricate tattoo on his left arm. The healthcare worker is holding a syringe and is in the process of injecting the vaccine into the man's arm. The background is a plain white wall.

THANK YOU!

New Zealand's Experience and Recovery from Covid-19

John McDermott

Covid-19 vs other pandemics

Table 1: *Twelve large pandemic events with at least 100,000 deaths*

Event	Start	End	Deaths
Black Death	1331	1353	75,000,000
Great Plague of London	1665	1666	100,000
First Asia Europe Cholera Pandemic	1816	1826	100,000
Second Asia Europe Cholera Pandemic	1829	1851	100,000
Russia Cholera Pandemic	1852	1860	1,000,000
Global Flu Pandemic	1889	1890	1,000,000
Sixth Cholera Pandemic	1899	1923	800,000
Encephalitis Lethargica Pandemic	1915	1926	1,500,000
Spanish Flu	1918	1920	100,000,000
Asian Flu	1957	1958	2,000,000
Hong Kong Flu	1968	1969	1,000,000
H1N1 Pandemic	2009	2009	203,000

Source: https://en.wikipedia.org/wiki/List_of_epidemics and references therein.

Mortality vs employment in the Spanish Flu

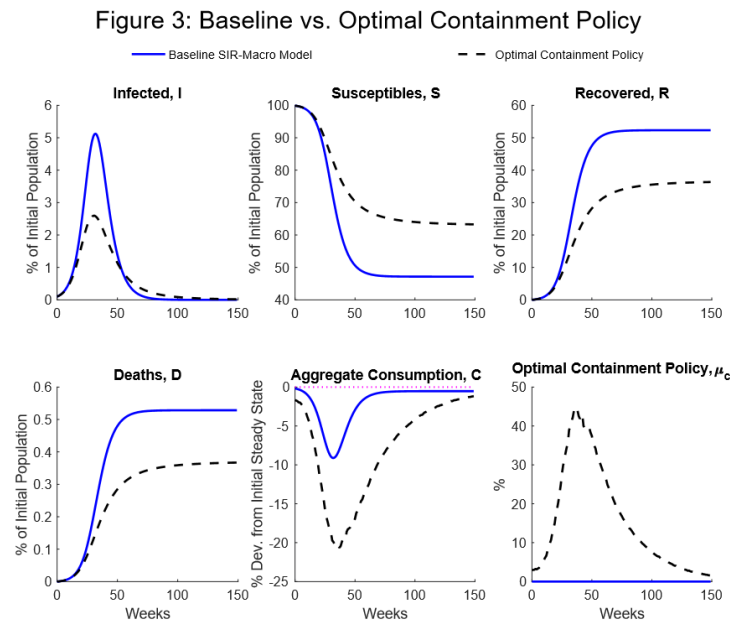

- Cities that intervened earlier and more aggressively did not perform worse and, if anything, grew faster after the pandemic was over.

- Green = cities with non-pharmaceutical interventions above the median
- Red = cities with non-pharmaceutical interventions below the median

Containment versus the economy

- Eichenbaum et al (2020) study the interactions between economic decisions and epidemics.
- Government interventions of imposing containment improve social outcomes.

Long term consequences

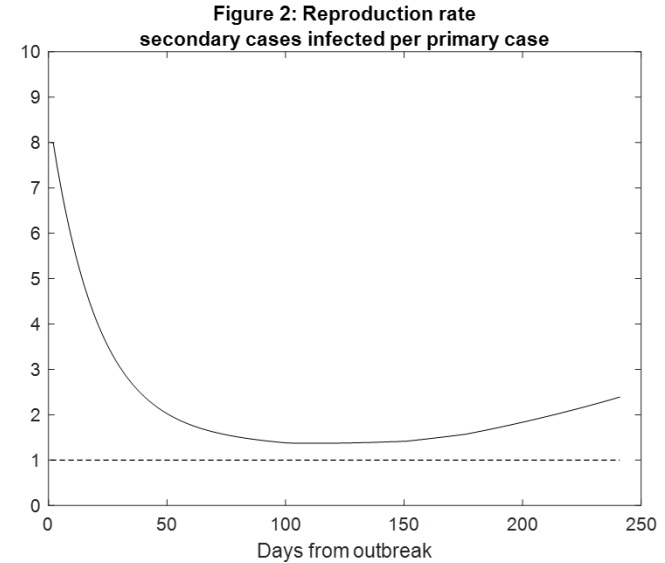

- Interest rates will be 2% lower than they would otherwise have been 20 years on.

Figure 2: Response of the European real natural rate of interest following pandemics

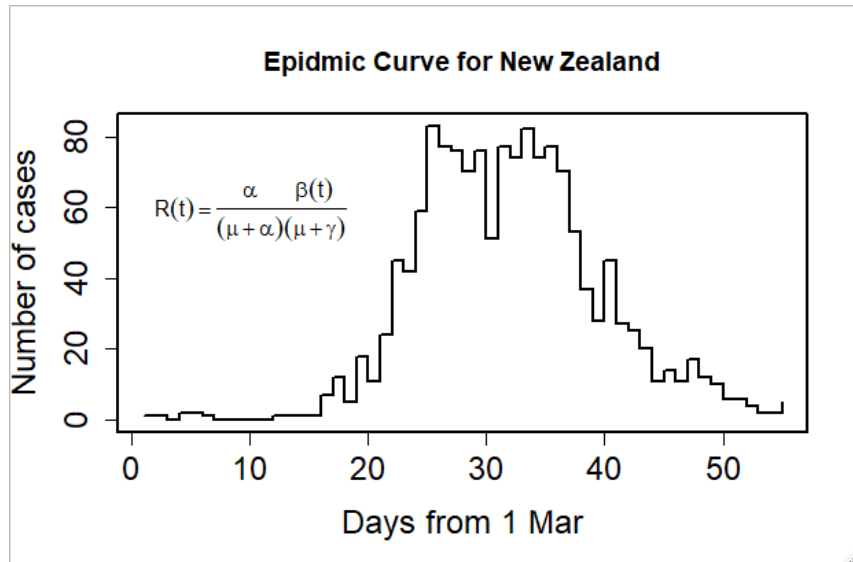

Notes: Response calculated using Equation 2. Shaded areas are 1 and 2 s.d. bands around response estimates. See text.
