

2018 Leonard Cockayne Lecture

Ornamental to detrimental: The invasion of New Zealand by non-native plants

Professor Philip Hulme FRSNZ
Bio-Protection Research Centre
Chair in Plant Biosecurity, Lincoln University

Aotearoa has more types of non-native plants than almost anywhere else in the world. It was believed that such non-natives would never pose a risk to our native flora, but many of these introduced species are now causing significant economic and environmental costs.

Philip explores New Zealand's history of plant invasions and examines the underlying causes and potential future trends. Some of these invasive plants have been introduced as commercial crops such as pine and pasture grasses, while others arrived as ornamentals from around the world for both home and botanic gardens.

Could invasive plants and non-native weeds choke our country? What are the tools to control these current and future flora threats?

Presented in partnership with the
Bio-Protection Research Centre.
Academy Lectures share the expertise of
New Zealand researchers through the ties
